

# Finding Shortest Paths in Unweighted Directed Graph

Single source Shortest path - Find path to all other vertices  
Source vertex (start)

$d=0$

$d=1$

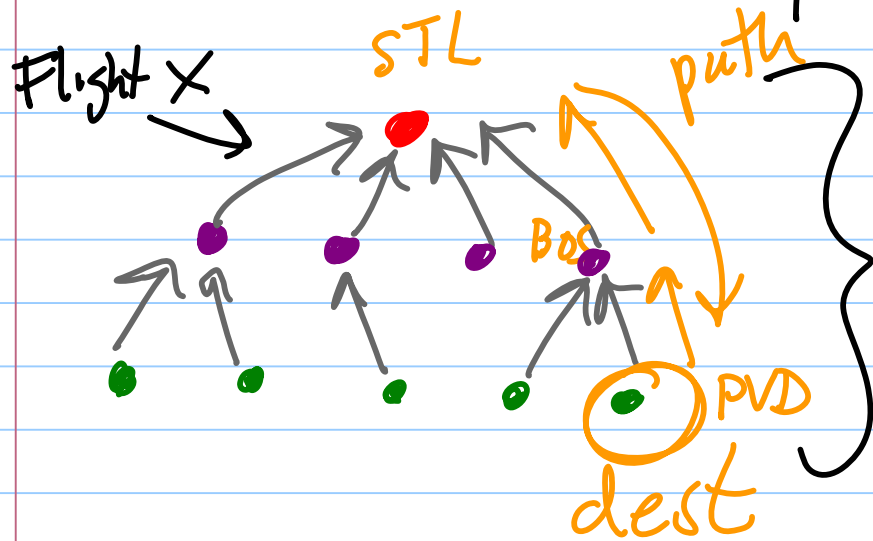

$d=2$

directly reachable from S

Keep going until the desired destination is reached

How do we represent the solution?

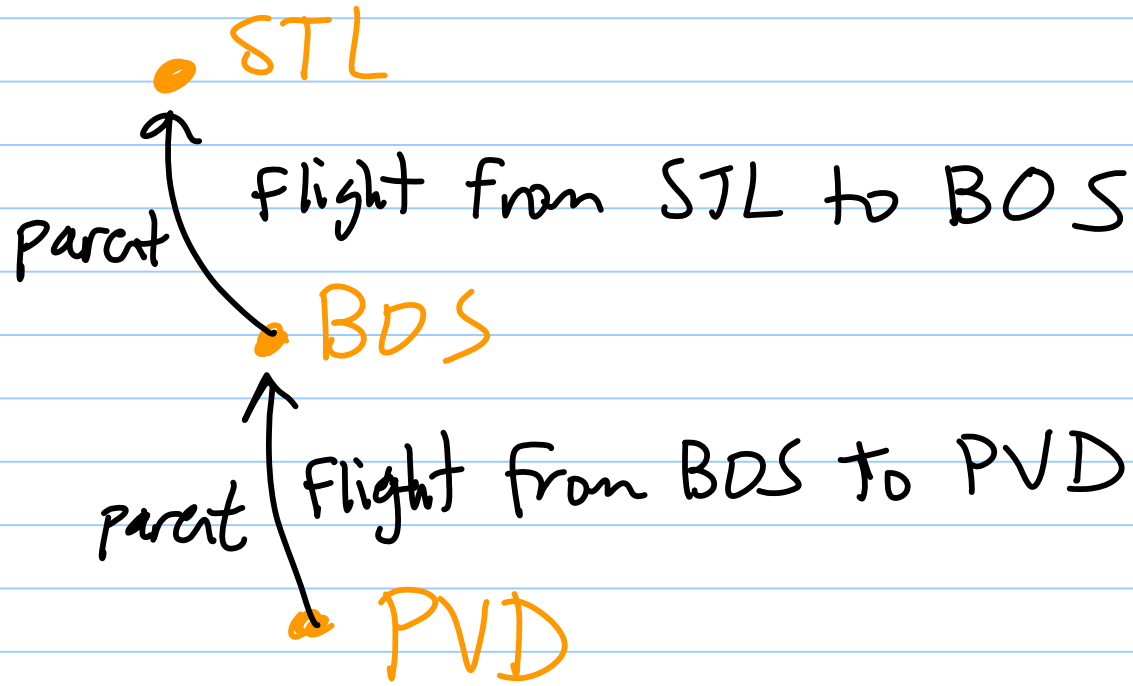

Shortest path tree

Source is root

[ represent implicitly by storing the edge from parent.

# Shortest path tree

Source a  
 ↑ parent

Queue: ~~a~~ ~~b~~ ~~c~~ ~~d~~ ~~e~~ ~~f~~ ~~g~~ ~~h~~ ~~i~~

# Time complexity

entire  
alg

$O(n)$

(every vertex is placed into +  
removed from queue  $\leq 1$  time

adj list

$O(n+m)$

(iterate over outedges of each  
vertex at most once each

$O(n+m)$  adj list,  $O(n^2)$  adj matrix

# Dijkstra's Shortest Path Algorithm

Note Title

11/20/2007

First let's review breadth  
first search (bfs) that  
solves the single-source shortest  
path algorithm for an **unweighted**  
graph

## BFs(V source)

for each  $u \in V$

$u.\text{discovered} = \text{false}$

$u.\text{dist} = \infty$

$u.\text{parentEdge} = \text{null}$

$\text{source}.\text{discovered} = \text{true}$

$\text{source}.\text{dist} = 0$

$\text{queue}.\text{enqueue}(\text{source})$

initialization

while ( $!\text{queue}.\text{isEmpty}()$ )

$u = \text{q}.\text{dequeue}()$

for each edge  $e$  in outgoing edges from  $u$

$v = e.\text{dest}$

if ( $!\text{v}.\text{discovered}$ )

$\text{v}.\text{discovered} = \text{true}$

$\text{v}.\text{dist} = \text{u}.\text{dist} + 1$

$\text{v}.\text{parentEdge} = e$

$\text{queue}.\text{enqueue}(v)$

Upon completion of BFS

any vertices not discovered are not reachable from source

for all discovered vertices  $v$

$v$ .dist is # of edges in a shortest path from source to  $v$

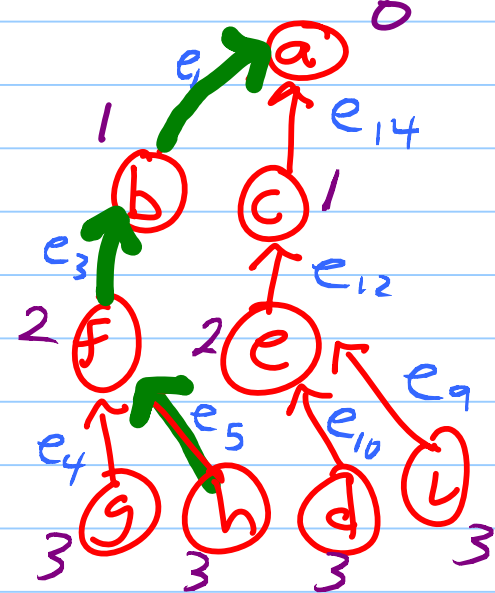

following parent references from  $v$  to  $s$  gives a shortest path from  $s$  to  $v$  (in reverse order)

Time complexity  $O(n+m)$  with adj list

# Example from last class

Shortest path tree

X means it was discovered

Vo dist shown in purple

Shortest path from a to h  
e<sub>1</sub>, e<sub>3</sub>, e<sub>5</sub>
